

SMARTAPESG CAMPAIGN USES CLICKFIX TECHNIQUE TO PUSH REMCOS RAT

Introduction

The SmartApeSG (also known as ZPHP or HANEYMANEY) campaign uses social engineering attacks called the ClickFix to distribute malware, primarily the Remcos RAT.

SmartApeSG compromises legit websites and injects malicious JavaScript code. When the user visits the website, they are redirected to a fake CAPTCHA page mimicking Cloudflare's Turnstile verification that triggers the infection. Mentioned in the title, ClickFix is a social engineering technique that tricks users into manually executing malicious commands on their own computers.

Remcos (Remote Control and Surveillance) is a Remote Access Trojan (RAT) that is designed to give full unauthorized control of a Windows computer. Since there is also surveillance, it can also activate the microphone and camera of the infected device.

Methodology

I obtained this PCAP malware sample ready to be analyzed, from [malware-traffic-analysis.net](https://www.malware-traffic-analysis.net). The link to download the PCAP file is given below:
<https://www.malware-traffic-analysis.net/2026/01/22/2026-01-22-SmartApeSG-ClickFix-pushes-Remcos-RAT.pcap.zip>

The main tool I will use, since this is a packet capture file, will be Wireshark and I also used Virus Total to check malicious content found within the packet capture. And the password to crack this zip file is infected_20260122.

To do this project, I did not extract any files or executables from this packet capture for the safety of my network and machine, since this is actual malware and there are actually malicious files inside the packet capture.

Results

First, I ran capinfos to get the general overview of the packet capture, which gets the hash of the PCAP as well.

```

After opening the Conversations tab, we can see 1 IP talking to a lot of other hosts, so we can already conclude that 10.1.22.101 is the infected client. But from the looks of this, so far there are no beaconing pattern

Then, I tried filtering for DNS queries to see where they are made to

We can see that the first line shows a DNS query to secretsof.com, but after searching it up at Virus Total, I found it to be not malicious and clean. And when I Googled what site it is, it is a marketplace website, and since it is the first packet to this packet capture, it is speculated the website has already been compromised by SmartApeSG.

The screenshot shows the VirusTotal interface for the URL <http://secretsof.com/>. The Community Score is 0/95. A message states: "No security vendors flagged this URL as malicious". The status is 200, content type is text/html; charset=UTF-8, and the last analysis date is 2 days ago. The analysis is categorized under DETECTION, DETAILS, and COMMUNITY. A banner encourages joining the community for insights and API access. Below, the "Security vendors' analysis" table shows results from 13 vendors, all marked as "Clean".

Security vendors' analysis	
Abusix	Clean
ADMINUSLabs	Clean
AlienVault	Clean
Antiy-AVL	Clean
Acronis	Clean
AILabs (MONITORAPP)	Clean
alphaMountain.ai	Clean
benkow.cc	Clean

There we also see the Google Tag Manager (googletagmanager.com), and it is a legit website owned by Google. It is used by website owners to deploy marketing tags which are scripts, without interfering with the code. However, if compromised, it can also be used by attackers to inject the malicious code. Knowing this hack is about injecting JavaScript code, it probably got it at the DNS query to googletagmanager.com.

In the DNS queries, I also saw a query to flautister.com, which is flagged as malicious by Virus Total.

The screenshot shows the VirusTotal interface for the domain flautister.com. The Community Score is 13/94. A message states: "13/94 security vendors flagged this domain as malicious". The creation date is 2 months ago, and the last analysis date is 16 days ago. The analysis is categorized under DETECTION, DETAILS, RELATIONS, and COMMUNITY. A banner encourages joining the community for insights and API access. Below, the "Security vendors' analysis" table shows results from 13 vendors, all marked as "Malicious".

But here we see in the first packet for DNS query to secretsof.com in the first packet. After that, we get a TCP SYN to 104.21.2.21, and after that it does a Client Hello to cloudflare-ech.com which is the ECH (Encrypted Client Hello) to hide, secretsof.com, which is the true destination inside TLS. We know both are related since both are 104.21.2.21. So, even though previously it was flagged clean in Virus Total, it is not guaranteed to be 100% safe since it has been compromised.

I also tried searching for the word "captcha" throughout the packet capture but did not find anything, since perhaps the communication did encrypted by TLS.

Conclusion

The entry point of the attack comes from secretsof.com to the victim IP of 10.1.22.101, which the website is already compromised. Then it loads up scripts from googletagmanager.com. Then it initiates a connection to flautister.com which uses an encryption connection so I cannot see what is inside. Then the user is met with a fake CAPTCHA page that when the user clicks on verify it auto downloads the Remcos RAT.

Indicators of Compromise (IoCs)

- Infected Host: 10.1.22.101
- Malicious Domain:
 - flautister.com
- Compromised Website:
 - secretsof.com
- Abused Legitimate Services:
 - googletagmanager.com
 - cdn.jsdelivr.net
- Malicious IP Address: 89.46.38.67
- Suspicious IP Address: 98.142.251.63
- Suspicious Port: 443
- Protocol: Encrypted TCP (TLS / HTTP/2 "h2")
- Behavior:
 - Early communication with malicious domain
 - Encrypted traffic (payload not visible)
 - ClickFix redirection (fake CAPTCHA)

- User execution via PowerShell command
- No persistent beaconing observed
- No direct payload download in PCAP

Recommendation

Be sure to not click on suspicious CAPTCHA pages as they might be fake and download a good anti virus platform on your computer, therefore it can detect something if it has downloaded something malicious.

Before doing activities on suspicious links, the link should be checked through Virus Total. Since Virus Total has the results of numerous anti virus platforms, knowing whether something is malicious or not through its hash, usually it is accurate.

It is also useful to use an Endpoint security system if something like this were to happen again.
